A simple pencil sketch of a tall, rectangular container, possibly a vase or a jar. The drawing shows a vertical rectangle with a slightly irregular top edge. Two small, circular features, resembling handles or knobs, are positioned near the bottom center of the front face. The sketch is done with light pencil strokes on a white background.

difference of  $\pi/2$  at  $t = 0$ . The displacement  $s$  of the string at time  $t$  is given by the formula  $s = A \sin(\omega t + \phi)$ , where  $A$  is the amplitude,  $\omega$  is the angular frequency, and  $\phi$  is the initial phase. If the string is initially at rest, then  $\dot{s} = 0$  at  $t = 0$ . This implies that  $\phi = 0$ . Therefore, the displacement  $s$  is given by  $s = A \sin(\omega t)$ .
